Job Market Paper

"Markups: Risk and Market Power."

We quantify the relative contributions of oligopoly market power and idiosyncratic risk to firm-level markups. We develop a general equilibrium model of granular firms competing in a product network under cost and demand uncertainty, where managers face source-dependent risk penalties. Exploiting a latent factor structure in revenues and profits, we jointly estimate baseline market power, the cost risk premium, and the demand risk premium for U.S. public firms. We find that idiosyncratic risk accounts for 4% of observed net markups, demonstrating that standard market power remains the driver of markups. Finally, through a principal-agent framework, we show that the welfare loss attributable to idiosyncratic risk is approximately 1%.
